Ms. Brenda Halpin, Director
State of Connecticut
Office of the State Comptroller
Retirement Services Division
55 Elm Street
Hartford, CT 06106
Dear Ms. Halpin:
Enclosed is the "Connecticut State Employees Retirement System Experience Investigation for the Four-Year Period Ending June 30, 2015". The investigation includes the demographic experience for the Connecticut State Employees Retirement System (SERS).

Please let us know if there are any questions concerning this report.
Sincerely,

John J. Garrett, ASA, FCA, MAAA Principal and Consulting Actuary

Edward J. Koebel, EA, FCA, MAAA Principal and Consulting Actuary

## C O N SULTIN G, LLC

The experience and dedication you deserve
August 17, 2016

State of Connecticut
State Employees Retirement Commission
55 Elm Street
Hartford, CT 06106
Members of the Commission:

We are pleased to submit the results of an investigation of the demographic experience for the Connecticut State Employees Retirement System (SERS). The purpose of the investigation was to assess the reasonability of the demographic actuarial assumptions for the System. The actuarial assumptions are utilized by the actuary to provide a best estimate of the value of all benefits expected to be paid by the System over future years. The valuation also uses various actuarial methods in determining the required funding necessary to accumulate a sufficient amount of assets to fully fund the expected benefit payments.

This experience study covers the four-year period from July 1, 2011 to June 30, 2015. As a result of the investigation, it is recommended that revised tables be adopted by the SERS Retirement Commission for future use. Changing the assumptions will not change the actual cost of future benefits but will impact the measurement of the expected value of future benefits and the required contributions to maintain actuarial soundness.

The investigation of the experience of members of the System includes all active and retired members as well as beneficiaries of deceased members. In some instances, the experience was investigated separately for males and females where difference in gender was correlated to material differences in experience.

The results of the investigation indicate that the current assumed rates of separation from active service due to withdrawal, disability, retirement and mortality do not accurately reflect the actual and anticipated experience of the System. As a result of the investigation, new withdrawal, disability, retirement and mortality tables have been developed which reflect more closely the actual experience of the membership.

## Members of the Commission

August 17, 2016
Page 2

This report shows a comparison of the actual and expected cases of separation from active service, actual and expected number of deaths, and actual and expected salary increases. These tables are shown based on current assumed expected rates and based on new proposed expected rates. A comparison between the rates of separation and mortality presently in use and the recommended revised rates are also shown in this report.

All rates of separation, mortality and salary increase at each age for each system are shown in the attached tables in Appendix A of this report. In the actuary's judgment, the rates recommended are suitable for use until further experience indicates that modifications are desirable.

The experience investigation was performed by, and under the supervision of, independent actuaries who are members of the American Academy of Actuaries with experience in performing valuations for public retirement systems. The undersigned meet the Qualification Standards of the American Academy of Actuaries to render the actuarial opinion contained herein.

Respectfully submitted,

John J. Garrett, ASA, FCA, MAAA
Principal and Consulting Actuary

Edward J. Koebel, EA, FCA, MAAA Principal and Consulting Actuary

## Section I: Executive Summary

## Section I

## Executive Summary

The following summarizes the findings and recommendations with regard to the assumptions utilized for the State of Connecticut Retirement Systems. Detailed explanations for the recommendations are found in the sections that follow.

## Economic Assumption Changes

The economic assumptions include price inflation, investment rate of return and wage inflation. The economic assumptions were reviewed and discussed by a group including the Comptroller's Office, the Office of Policy and Management, and the State Treasurer's Office. Management and the State Employees Bargaining Agent Coalition (SEBAC) are currently discussing the recommendations and analysis done by this group. In order not to interfere with the progress of that review, we are not including the economic assumptions as part of this study.

## Demographic Assumption Changes

The table below lists the demographic assumptions that should be changed based on the experience of the last four years.

| Assumption | Recommendations |
| :--- | :---: |
| Withdrawal | Recommend changes for Non-Hazardous and Hazardous <br> Employees |
| Disability Retirement | Recommend changes for Early, First Eligible and Ultimate <br> Retirement and Split by Tier |
| Service Retirement | Recommend Update to Projected White Collar version of <br> RPH-2014 Mortality Table |
| Mortality | Recommend no change in Merit Scale |
| Salary Scale |  |

## Section I: Executive Summary

## Other Assumption and Method Changes

The table below lists the other assumptions and methods used in the valuations and our recommendations. As with the Economic Assumptions, several other actuarial methods, including the actuarial cost method and the amortization payment method, are being reviewed by a collective group in the State of Connecticut. Therefore, we are not including a review of those methods as part of this study.

| Assumption | Recommendations |
| :--- | :---: |
| Actuarial Cost Method | Not studied |
| Asset Smoothing | Recommend no change from 5 year Smoothing |
| Amortization Method | Recommend a layered UAAL amortization approach <br> beginning with the 2016 valuation. New UAAL layers <br> composed experience gains and losses will be amortized over <br> a closed 25-year period from valuation date they were initially <br> measured. Changes to assumptions and methods would also <br> be captured in the any UAAL layers. |

## Financial Impact

The following table highlights the impact of the recommended changes on the principal valuation results.

| Impact on Principal Valuation Results (\$ in thousands) |  |  |  |
| :---: | :---: | :---: | :---: |
|  | Valuation Results June 30, 2014 | Demographic Changes Only | Demographic Changes and Layered UAAL |
| Unfunded Accrued Liability | \$14,920,815 | \$15,630,208 | \$15,630,208 |
| Funding Ratio | 41.5\% | 40.4\% | 40.4\% |
| Actuarially Determined Employer Contribution Rate (ADEC) |  |  |  |
| Normal | 7.99\% | 8.38\% | 8.38\% |
| Accrued Liability | 35.43\% | 37.11\% | 36.75\% |
| Total | 43.42\% | 45.49\% | 45.13\% |
| Amortization Period (years) | 17.0 years | 17.0 years | 17.2 years |

## Section II: Demographic Assumptions

## Section II <br> Demographic Assumptions

There are several demographic assumptions used in the actuarial valuations performed for the Connecticut Retirement Systems. They are:

- Rates of Withdrawal
- Rates of Disability Retirement
- Rates of Service Retirement
- Rates of Post-retirement and Pre-Retirement Mortality
- Rates of Salary Increase

The Actuarial Standards Board has issued Actuarial Standard of Practice (ASOP) No. 35, "Selection of Demographic and Other Noneconomic Assumptions for Measuring Pension Obligations", which provides guidance to actuaries in selecting demographic assumptions for measuring obligations under defined benefit plans. In our opinion, the demographic assumptions recommended in this report have been developed in accordance with ASOP No. 35.

The purpose of a study of demographic experience is to compare what actually happened to the membership during the study period with what was expected to happen based on the assumptions used in the most recent Actuarial Valuations.

Detailed tabulations by age, service and/or gender are performed over the entire study period. These tabulations look at all active and retired members during the period as well as separately annotating those who experience a demographic event, also referred to as a decrement. In addition the tabulation of all members together with the current assumptions permits the calculation of the number of expected decrements during the study period.

If the actual experience differs significantly from the overall expected results, or if the pattern of actual decrements, or rates of decrement, by age, gender, or service does not follow the expected pattern, new assumptions are recommended. Recommended changes usually do not follow the exact actual experience during the observation period. Judgment is required to extrapolate future experience from past trends and current member behavior. In addition non-recurring events, such as early retirement windows, need to be taken into account in determining the weight to give to recent experience.

The remainder of this section presents the results of the demographic study. We have prepared tables that show a comparison of the actual and expected decrements and the overall ratio of actual to expected results (A/E Ratios) under the current assumptions. If a change is being proposed, the revised A/E Ratios are shown as well. Salary adjustments, other than the economic assumption for wage inflation discussed in the previous section, are treated as demographic assumptions.

## RATES OF WITHDRAWAL

## COMPARISON OF ACTUAL AND EXPECTED WITHDRAWALS

FROM ACTIVE SERVICE BASED ON CURRENT RATES
NON-HAZARDOUS

| CENTRAL AGE OF GROUP | NUMBER OF WITHDRAWALS |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | NON-HAZARDOUS |  |  |  |  |  |
|  | MALES |  |  | FEMALES |  |  |
|  | Actual | Expected | Ratio of Actual to Expected | Actual | Expected | Ratio of Actual to Expected |
| 20 | 377 | 337 | 1.119 | 283 | 232 | 1.220 |
| 25 | 538 | 561 | 0.959 | 529 | 547 | 0.967 |
| 30 | 459 | 498 | 0.922 | 603 | 622 | 0.969 |
| 35 | 345 | 366 | 0.943 | 461 | 512 | 0.900 |
| 40 | 315 | 351 | 0.897 | 482 | 507 | 0.951 |
| 45 | 400 | 431 | 0.928 | 569 | 566 | 1.005 |
| 50 | 424 | 412 | 1.029 | 603 | 565 | 1.067 |
| 55 | 355 | 313 | 1.134 | 480 | 384 | 1.250 |
| TOTAL | 3,213 | 3,269 | 0.983 | 4,010 | 3,935 | 1.019 |

The following graphs show a comparison of the present, actual and proposed rates of withdrawal at each of the service breakdowns.

## Section II: Demographic Assumptions

## RATES OF WITHDRAWAL FOR NONHAZARDOUS ACTIVE MEMBERS

## Section II: Demographic Assumptions

The rates of withdrawal adopted by the Commission are used to determine the expected number of separations from active service which will occur as a result of resignation or dismissal. Overall, the preceding results indicate that the actual number of nonhazardous withdrawals that occurred during the study period were very close to what was expected. However, we are recommending some minor adjustments in the rates of withdrawal to narrow the difference. An example of a changes is to lower the rates of withdrawal in the first two years of service for ages after 30 .

The following tables show a comparison between the present withdrawal rates and the proposed withdrawal rates for nonhazardous members.

COMPARATIVE RATES OF WITHDRAWAL FOR NONHAZARDOUS MEMBERS

| PRESENT RATE OF WITHDRAWAL <br> Nonhazardous Males |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 45 | 81 | 59 | 1.373 | 46 | 33 | 1.394 |
| 50 | 53 | 35 | 1.514 | 34 | 20 | 1.700 |
| 55 | 40 | 15 | 2.667 | 17 | 10 | 1.700 |
| TOTAL | 478 | 507 | 0.943 | 257 | 264 | 0.973 |

The preceding results indicate that the actual number of hazardous withdrawals that occurred during the study period were less than expected at earlier ages and more than expected at older ages. Therefore, we recommend adjusting the rates of withdrawals to better match the experience.

The following tables show a comparison between the present withdrawal rates and the proposed withdrawal rates for hazardous members.

## Section II: Demographic Assumptions

COMPARATIVE RATES OF WITHDRAWAL FOR HAZARDOUS MEMBERS

| PRESENT RATE OF WITHDRAWAL Hazardous Males |  |  |  |  |  |  |  |  |

## Section II: Demographic Assumptions

## RATES OF DISABILITY RETIREMENT

COMPARISON OF ACTUAL AND EXPECTED DISABILITY RETIREMENTS

| $\begin{aligned} & \text { CENTRAL } \\ & \text { AGE OF } \\ & \text { GROUP } \end{aligned}$ | NUMBER OF DISABILITY RETIREMENTS |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Hazardous |  |  | Nonhazardous |  |  |
|  | Actual | Expected | $\begin{gathered} \text { Ratio of Actual } \\ \text { to Expected } \end{gathered}$ | Actual | Expected | Ratio of Actual to Expected |
| 30 | 2 | 2 | 0.858 | 1 | 4 | 0.234 |
| 35 | 5 | 9 | 0.571 | 3 | 6 | 0.502 |
| 40 | 12 | 20 | 0.612 | 18 | 19 | 0.968 |
| 45 | 29 | 25 | 1.167 | 19 | 37 | 0.519 |
| 50 | 18 | 26 | 0.698 | 56 | 71 | 0.793 |
| 55 | 15 | 22 | 0.696 | 112 | 112 | 0.999 |
| 60 | 13 | 16 | 0.792 | 87 | 112 | 0.776 |
| 65 | 13 | 16 | 0.815 | 54 | 95 | 0.568 |
| TOTAL | 107 | 135 | 0.791 | 350 | 455 | 0.768 |

The following graphs show a comparison of the present, actual, and proposed rates of disability retirements.

The preceding results indicate that the actual number of disability retirements was less than expected during the study period over most age groups and for both hazardous and nonhazardous employees. We recommend a slight decrease in the rates of disability retirement at most ages to more closely reflect the experience of the System and we recommend continuation of the postdecrement probability of $20 \%$ for In-Service disability retirements and $80 \%$ for Not-In-Service disability retirements.

## Section II: Demographic Assumptions

The following table shows a comparison between the present disability retirement rates and the proposed rates.

COMPARATIVE RATES OF DISABILITY RETIREMENT

| AGE | RATES OF DISABILITY RETIREMENT |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Hazardous |  | Nonhazardous |  |

## Section II: Demographic Assumptions

The following graphs show a comparison of the present and actual rates of service retirements.

## Retirement Rates - Nonhazardous <br> Total

## Section II: Demographic Assumptions

The preceding results indicate that for hazardous service retirements, the actual number of retirements overall was significantly higher than the expected number over this period, especially in the first year of eligibility for retirement. Similar experience was seen in the 2011 experience investigation. Therefore, we recommend increasing rates of retirement for hazardous employees at mostly all ages.

For non-hazardous service retirements, the tables on the preceding pages show actual and expected experience for early retirement, first year of normal retirement and ultimate normal retirement. The numbers are further broken down by Tier. The following key observations were found in the experience:

- Actual early retirements for Tiers II and IIA were less than expected,
- Actual first year eligible Tier I retirements were concentrated around age 55,
- Actual ultimate retirements were slightly less than expected for Tier I but significantly less than expected for Tiers II and IIA,
- Over the four year period, there were 134 service retirements from Tier III, most of those were transfers from the Alternate Retirement Plan (ARP).

Therefore, we recommend new service retirement rates for all Tiers, including Tier III.

## Section II: Demographic Assumptions

The following graphs show a comparison of the present, actual and proposed rates of postretirement deaths.

## POST-RETIREMENT DEATHS SERVICE RETIREMENTS AND BENEFICIARIES OF DECEASED MEMBERS

Section II: Demographic Assumptions

POST-RETIREMENT DEATHS
DISABILITY RETIREMENTS

## Section II: Demographic Assumptions

Assumed rates of post-retirement mortality are very important assumptions for the actuarial valuation because they predict life expectancies and therefore, the duration of pension payments. As life expectancies are expected to continue to increase in the future, mortality rates are usually projected by actuaries to anticipate expected mortality improvements.

The current assumed rates of mortality for both males and females anticipated more deaths than actually occurred during the four year study period. The male rates predicted $87.6 \%$ of actual deaths and the female rates predicted $86.7 \%$ of actual deaths. When projecting future mortality improvements, we would expect actual deaths during the study period to be somewhat greater than expected deaths which is not the case. We recommend a change to the mortality rates used in the actuarial valuations that is based on updated mortality research and produces rates which anticipates the continuing trend in mortality improvement.

We recommend that the rates of retiree and beneficiary mortality be revised to the RP-2014 White Collar Mortality Table projected to 2020 by Scale BB at $95 \%$ for females. Compared to the current mortality table, this new mortality table extends life expectancy by an estimated 1.5 years for males and 2.0 years for females.

In addition, we recommend that the rates of disability mortality be revised to the RP-2014 Disabled Retiree Mortality Table at $65 \%$ for males and $85 \%$ for females.

For pre-retirement mortality, we recommend that the rates of mortality be revised to the RP-2014 White Collar Mortality Table projected to 2020 by Scale BB at $60 \%$ for males and $55 \%$ for females.

## Section II: Demographic Assumptions

The following table shows a comparison between the present and proposed rates of mortality.

## COMPARATIVE RATES OF POST-RETIREMENT SERVICE RETIREMENTS AND BENEFICIARIES OF DECEASED MEMBERS

| TOTAL | $\mathbf{1 2 , 8 8 3}$ | $\mathbf{1 2 , 5 1 7}$ | $\mathbf{1 . 0 2 9}$ |

The preceding results indicate that salary increases were slightly higher than expected over this four-year period. We recommend no change in the merit rates of salary increase at this time.

## OTHER ASSUMPTIONS AND METHODS

ASSETS: Currently, the actuarial value of assets recognizes a portion of the difference between the market value of assets and the expected actuarial value of assets, based on the assumed valuation rate of return. The amount recognized each year is $20 \%$ of the difference between market value and expected actuarial value. In addition, the actuarial value of assets is constrained to an $80 \%$ to $120 \%$ corridor around the market value of assets. This methodology is a common asset smoothing method and we recommend no change at this time.

VALUATION COST METHOD: The valuation cost method is used to allocate the present value of benefits between past service (actuarial accrued liability) and future service (normal cost). Currently, the valuation uses the Projected Unit Credit (PUC) Cost Method. Since this method is currently being reviewed by a collective group in the State of Connecticut, we have not reviewed a change as part of this study.

AMORTIZATION METHOD: As of the 2014 actuarial valuation, a level percent of payroll with a closed 17-year period is used as an amortization method to pay off the Unfunded Actuarial Accrued Liability (UAAL). Since this method is also currently being reviewed by a collective group in the State of Connecticut, we have not reviewed a change as part of this study.

However, we do recommend that the Actuarial Subcommittee and the Commission consider a layered UAAL amortization approach beginning with the 2016 valuation. Under the current method, all future changes in the UAAL will be amortized by a shrinking period. As amortization periods decrease, payments will become increasingly more volatile with certain experience. To avoid the volatility of short amortization periods, we recommend new UAAL layers composed of experience gains and losses be amortized over a closed 25 -year period from the valuation date they were initially measured. Also, changes to assumptions and methods would also be captured in the any UAAL layers.

PERCENT MARRIED: Currently, $80 \%$ of active members are assumed to be married with the male three years older than his spouse. Active members are assumed to have two children. Since the data we currently have does not include spousal information, we will recommend no change to this assumption at this time, but will review closely during the next experience study.

SERVICE-RELATED DEATHS: Currently, 20\% of pre-retirement deaths are assumed to be service related. Since the data we currently have does not distinguish deaths, we will recommend no change at this time.

SERVICE-RELATED DISABILITY: Currently, 20\% of disability retirements are assumed to be service-related. We have reviewed the data and recommend no changes at this time.

## Appendix A - Proposed Demographic Assumptions
